System Specification

October 2, 2020

This document is created directly from the definitions in the file dqtt.ott, with minor modifications listed below.

It is intended to specify, in a readable form, the subject of the proofs in Section 6.2.

Note: there is one change here from the syntax shown in the paper. We replace the pattern matching elimination form for Σ types with a slightly more general, but less familiar, form.

The reason for this change is that the Ott and LNgen tools limit language specifications to single binding only. This prevents us from the usual definition of the pattern matching elimination form for Σ -types. Instead, we use an elimination form called "spread" of the form

spread a to x in b

This syntactic form binds the variable x (corresponding to the first component of the product) in the body b. The body b must itself be a function, where the argument is the second component of the tuple.

In other words, we can encode an elimination of an argument a of type Σx : ${}^{q}A.B$, that uses the usual pattern matching syntax

$$let(x, y) = a in b$$

by using the term

spread a to x in λy : $^q A.b$

1 Grammar

2 Step relation

S-BoxCong
$$a \rightsquigarrow a'$$

$$\overline{\textbf{let box } x = a \text{ in } b \rightsquigarrow \textbf{let box } x = a' \text{ in } b}$$
S-CaseCong
$$\overline{\textbf{let box } x = \textbf{box}_q a \text{ in } b \rightsquigarrow b\{a/x\}}$$
S-Case1Beta
$$\overline{\textbf{case}_q (\textbf{inj}_1 a) \text{ of } b_1; b_2 \rightsquigarrow b_1 a}$$
S-Case2Beta
$$\overline{\textbf{case}_q (\textbf{inj}_2 a) \text{ of } b_1; b_2 \rightsquigarrow b_2 a}$$
S-SpreadCong
$$\overline{\textbf{a} \rightsquigarrow a'}$$

$$\overline{\textbf{spread } a \text{ to } x \text{ in } b \rightsquigarrow \textbf{spread } a' \text{ to } x \text{ in } b}$$
S-SpreadBeta
$$\overline{\textbf{spread } (a_0, a_1) \text{ to } x \text{ in } b \rightsquigarrow b\{a_0/x\} a_1}$$

3 Typing relation

Another issue with Σ types is that Ott cannot express the complete typing rule for **spread**. Therefore we need to modify the generate Coq definition to include the appropriate substitution. This document includes the corresponding change in the typeset rule T-SPREAD.

```
T-conv
      \Delta; \Gamma_1 \vdash a : A
  \Delta; \Gamma_2 \vdash B : \mathbf{type}
                                                                                                             T-Unit
